(S) Current Research /Teaching Interests

Synthesis and characterization of amorphous/crystalline semiconductors in bulk and in thin film using XRD, DTA, DSC, EPMA etc. Investigations of electronic and optical properties of synthesized materials using DC conductivity, AC conductivity, dielectric relaxation, thermo-electric power, photoconductivity, transmission and reflectivity measurements.

Study of MeV energy heavy ion induced defects in synthesized amorphous/ crystalline semiconductors in bulk and in thin film form, which is front line area of research, is also being undertaken. The defects are monitored by optical studies, AC and DC conductivity measurements. The findings have been published in various International/National Journals of repute and presented during many International/ National Conferences/Symposia etc. Preparation and study of nanomaterials has also been initiated.

Work on development, characterization and properties of silver and Nd composites in silicate glass matrices have also been undertaken. Polymers have also been synthesized and studied. The findings have been published in international journals. Presently the work on TeO₂ based glasses and ceramics is in progress. The study will help developing materials for specific uses including the ones used in optical coatings for HUD.

Courses for M.Sc. have been modified in GJUS&T, Hisar to include recent topics/materials such as magnetic materials, nano materials etc. New contents in M.Tech. Optical Engineering have been introduced. The M.Sc. Physics course at CBLU, Bhiwani is also being modified.
